

Sergey Gyach

github.com/gyach | sergey@gyach.ru | [@gyach](#) | MAX | <https://sergey.gyach.ru>

I help product, engineering, and business stakeholders turn complex B2B goals into clear requirements, user journeys, API and integration contracts, and AI-assisted delivery workflows.

How I Help

- Break down business goals, constraints, and conflicting expectations into user flows, requirements, and decisions engineering teams can act on.
- Help teams align on scope, API contracts, integrations, readiness criteria, and the tradeoffs behind each decision.
- Use AI-assisted workflows for requirement drafts, prototypes, documentation, and early checks for missing logic.
- Surface edge cases, exception paths, and acceptance criteria before implementation so fewer issues are discovered late.

Experience

2023 - Present | HRlink | Head of Business & Systems Analysis

Lead business and systems analysis for a B2B HR tech platform. Turn product goals into clear requirements, user flows, API and external integration contracts, and delivery processes that reduce rework. Introduce AI-assisted analysis, prototyping, and documentation practices to improve team throughput.

2020 - 2023 | MTS | Customer Experience Lead, Internal Platforms

Led customer experience research and product improvements for internal engineering platforms covering IT investment planning, reliability, monitoring, and observability. Translated research findings into clearer workflows and process changes for technical users.

Earlier | Customer service, logistics, human resources, construction | 20+ years across business and operations domains

Worked with processes, requirements, and change across multiple domains: customer and operational workflows, stakeholder expectations, and translating practical business context into clear work for teams.

Artifacts

- Requirements and acceptance criteria
- API and integration contracts
- Process and system models
- User flows and CJM
- Prototypes and hypothesis checks
- Context and knowledge base

Core skills

- Business analysis, Systems analysis, Requirements lifecycle management, Acceptance criteria and release readiness.
- Scalable B2B platforms, Distributed application design, API and integration design, Event-driven architecture.
- Team leadership, Business analysis team management, Meeting facilitation, Stakeholder alignment.
- AI-assisted analysis workflows, Prompt design for analysis tasks, Workflow automation, Knowledge management systems.

Public Expertise

- Habr: TypeSpec for API specifications, Nov 23, 2024.
